

## Experimentality by Bernard Louis De Koven

Experimentality as an adult more expert version of playfulness. It is professional playfulness

why being playful for the sake of being playful is a wrong expression.

It is often implied that playful activities have some inherent qualities that allow for playfulness.

A robot programmed to build lego's will not necessarily be playful. Even when interacting with a playful activity.

That robot in that moment is technically being playful for the sake of being playful.

Also animals are often perceived to be playful when they are merely testing the limits of their abilities for evolutionary reasons. which is a dormant reason and not active but still a step higher than the robot.

And humans are definitely not playful for the sake of being playful. There is a direct and constant supply of satisfaction that is driving playfulness.

and we perceive them as feelings such as, fun, wonder, belief, devotion, joy, understanding and this is individual. reason why the games market is so diverse and gamers are so divided.
